

Forklift Fork Positioners

Forklift Fork Positioner - A fork positioner is an apparatus constructed out of top quality materials intended to endure the most difficult operations and work environments. This particular piece of equipment could enable the individual driving to control the blades hydraulically without leaving the seat. Side shifting units have the added ability to laterally position the entire load or the arms so as to facilitate more precise lifting and position in a quicker and more efficient way.

The blade pocket is somewhat unique and could enable the one operating it to be able to securely swing the blades into position without any worry of damaging the positioning cylinders. This could allow the driver the option to perform simultaneous or independent fork movement, dependent upon the job requirement. For most forklifts with non-OEM carriages, complete carriages are considered necessary. Standard OEM carriages could be transformed into fork positioners on existing units.
